```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          [-NDL-6
                                                                                                                                                                                                                                                                                                       -NUL-9
                                                    The present sequence is a peptide fragment of human luteinising hormone releasing hormone (also known as LHRH, GnRH and gonadotrophin releasing hormone), which has spacers inserted at the N-terminus. It was used to demonstrate the novel adjuvant of the invention, which has lower reactogenicity then previous compositions. Vaccination of humans and animals against LHRH can be used as a method of fertility control, as well as enabling the control and treatment of disorders of the reproductive organs, such as testicular, breast, prostate and ovarian cancers, prostate enlargement and endometriosis. The composition of the linvention contains an anionic macromolecule and a saponin component, the latter of which is an immunostimulant, and it can also be used with other immunogens including soluble protein antigens, peptide haptens conjugated to a carrier protein and whole viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAF15566 to AAF16505 encode the human prostate cancer associated proteins, called prostate cancer antigens, given in AAB56363 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases. AAF16506 to AAF16514 to AAB57303 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; prostate cancer; prostate cancer antigen; detection; diagnosis;
                    Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (AAIG2971-AAIG3793) and the encoded polypeptides (AAM42417-AAM42691) collectively known as kidney antigens and the use of such kidney antigens for detecting disorders of the kidney, especially kidney cancer and kidney cancer metastases. The polynuclectides and proteins are also useful for preventing, treating or ameliorating medical conditions useful for preventing, treating or ameliorating medical conditions of buman tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer, and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune hammolytic anaemia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis;
(c) carditovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           nucleic acids and polypeptides, useful for diagnosing, or preventing human diseases and disorders -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to novel kidney related polynucleotides

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This is the amino acid sequence of heavy chain construct 19B of novel human monoclonal antibodies (MAbs) reactive with the fusion of respiratory syncytial virus (RSV). The variable region was extracted from the Hu19 Fab plasmid C. The glycosylation region was extracted from the Hu19 Fab plasmid C. The glycosylation site in the CDR2 of 19B can be eliminated (see AAW59617-18) to reduce the heterogeneity of MAb expressed in eukaryotic host cells. Hu19A, Hu19B, Hu19B, Hu19C and Hu19D MAbs are claimed. These are reshaped human antibodies comprising a heavy chain selected from 19A, 19B, 19C or 19D (see AAW59615-18), and a light chain selected from 19A, 19B, 19C or 19D (see AAW59610-21). Such engineered antibodies are neutralising: they inhibit virus growth in vitro and in vivo in cannimal models of RSV infection. They can be used in the detection, prevention and passive immunotherapy of RSV infection. Nucleic acids encoding the human MAbs, recombinant plasmids (see AAV41427-33)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 10, 1

  1991:506492 Document No. 115:106492 Influence of the genetic background and
  carrier protein on the antibody response to GnRH. Sad, Subash; Talwar, G.
  P.; Raghupathy, Raj (Natl. Inst. Immunol., New Delhi, 110067, India). J.
  Reprod. Immunol., 19(2), 197-207 (English) 1991. CODEN: JRIMDR. ISSN:
  0165-0378.
- As a vaccine against the gonadotropin-releasing hormone (GnRH) is being developed as an immunol. method for the treatment of prostatic enlargement. The influence of the genetic back-ground on immune responses to GnRH conjugated to diphtheria toxoid (DT) was investigated. Mice of different strains were injected with the conjugate and the antibody levels against GnRH and DT quantitated in order to examine the effect of genetic background on immune responses to the hapten and the carrier. All immunized animals produced antibodies to DT. Anti-GnRH antibodies were generated by all strains of mice except 129. The low anti-GnRH response in the 129 strain mice did not appear to be MHC-linked, as C57BL/6 mice, which bear the same MHC haplotype as 129 mice, were able to generate a strong anti-GnRH response. The non-responsiveness to the hapten (GnRH) in 129 strain mice was overcome by the use of an "alternate carrier" approach.

- AB Disclosed is a sustained release pharmaceutical compn. The compn. includes a polyester contg. a free COOH group ionically conjugated with a bioactive polypeptide comprising at least one effective ionogenic amine, wherein at least 50% by wt. of the polypeptide present in the compn. is ionically conjugated to the polyester. The polyesters contain citric acid or tartaric acid.

ANSWER 2 OF 22 MEDLINE PubMed ID: 11353532. Synthesis, 2002010552 Document Number: 21252950. characterization, and labeling with 99mTc/188Re of peptide conjugates containing a dithia-bisphosphine chelating agent. Gali H; Hoffman T J; Sieckman G L; Owen N K; Katti K V; Volkert W A. (Department of Radiology, University of Missouri-Columbia, Columbia, Missouri 65211, USA. ) BIOCONJUGATE CHEMISTRY, (2001 May-Jun) 12 (3) 354-63. Journal code: 9010319. ISSN: 1043-1802. Pub. country: United States. Language: English. Radiolabeling of small receptor-avid peptides at specific predetermined AΒ chelation sites with radioactive metals has been an effective approach for production of target-specific radiopharmaceuticals for diagnosis and therapy of diseases. Among various electron-donating groups found on chelator frameworks, phosphines are unique because they display versatile coordination chemistry with a wide range of transition metals. We have recently reported the utility of a dithia-bis(hydroxymethyl)phosphinebased (P2S2) bifunctional chelating agent (BFCA) containing air-stable primary phosphine groups to form 99mTc-labeled receptor-avid peptides by the preconjugation approach. Here we report a novel strategy for labeling small peptides with both 99mTc and 188Re using the P2S2-COOH (6,8-bis[3-(bis(hydroxymethyl)phosphanyl)propylsulfanyl]octanoic acid) BFCA by a postconjugation radiolabeling approach. The first step in this approach involves the coupling of the corresponding (PH2)2S2-COOH intermediate to the N-terminus of the peptide(s). Formylation of P-H bonds with aqueous formaldehyde in the presence of HCl in ethanol affords the corresponding (hydroxymethyl)phosphine-P2S2-peptide conjugates in the form of an oxidatively stable phosphonium salt. The P2S2-peptide conjugates are generated (where the PH2 groups are converted to P(CH2OH)2 groups) by treatment of the P2S2-peptide phosphonium salt(s) with 1 M sodium bicarbonate solution at pH 8.5. Complexation of BFCA conjugates with 99mTc is achieved by direct reduction with Sn(II) tartarate to yield the 99mTc-P2S2-peptide conjugate in near quantitative yields. Complexation of the BFCA conjugates with 188Re is achieved by transchelation with 188Re citrate in yields of >/=90%. In this study, (PH2)2S2-COOH BFCA was conjugated to model peptides. The glycineglycine ethyl ester (GlyGlyOEt)-(PH2)2S2-COOH BFCA conjugate was converted to the hydroxymethylene phosphine form and complexed with 99mTc to produce the 99mTcO2-P2S2-GlyGlyOEt conjugate 8 in RCPs of >/=95%. This singular 99mTc product is stable over 24 h in aqueous solution as confirmed by HPLC. Identical retention times of the 99mTcO2-P2S2-GlyGlyOEt complex and its cold rhenium analogue (ReO2-P2S2-GlyGlyOEt) on HPLC indicates similarity in structures at the macroscopic and the tracer levels. The utility of this postconjugation strategy was further demonstrated by synthesizing a P2S2-D-Lys6-LHRH conjugate and producing its corresponding 99mTc complex in RCPs of >/=88%. Finally, the P2S2-5-Ava-BBN[7-14]NH2 bombesin (BBN) analogue was synthesized, the PH2 groups converted to P(CH2OH)2 groups and subsequently labeled with 188Re to yield a 188Re-labeled bombesin analogue with a RCP of >/=90%. The biological integrity of this conjugate was demonstrated in both in vitro and in vivo. The results of this investigation demonstrate that the (PH2)2S2-COOH BFCA can be conveniently used as a precursor for labeling small receptor-avid peptides with diagnostic (99mTc) and therapeutic (188Re) radionuclides via the postconjugation approach in high yields.

ANSWER 3 OF 22 CAPLUS COPYRIGHT 2002 ACS 2002:52034 Luliberin in contraceptive vaccines. Szewczuk, Apolinary; Kurowska, Ewa (Lab. Bialek Sygnalowych, Inst. Immunol. i Terapii Dosw., Polska Akad. Nauk, Wroclaw, 53-114, Pol.). Biotechnologia (4), 47-54 (Polish) 2001. CODEN: BIECEV. ISSN: 0860-7796. Publisher: Instytut Chemii Bioorganicznej PAN.

Luliberin (LH releasing-hormone, LHRH) is the key regulatory decapeptide AB that controls reprodn. in mammals. It is secreted by the hypothalamus and after binding to a specific receptor it initiates a series of events leading to the liberation of lutropin (LH) and finally steroid sex hormones. In some case, the infertility in females and males may be

explained by mutations of the LH or LHRH receptor genes. Immunization of animals with LHRH conjugates induces high titers of antibodies, resulting in the cessation of the biol. function of the hormone and, in the end, in a temporary infertility. In this review, the application of LHRH vaccines as birth control for women and men was presented. Being effective and inexpensive, semisynthetic LHRH vaccines are useful in the animal breading for immunocastration. The best vaccines are totally synthetic LHRH ones, which are much safer than the CG- or LH-vaccines based on antigens isolated from human material, which may be contaminated with pathogens.

  2000:405238 Document No.: PREV200000405238. Regulation of targeted
  chemotherapy with cytotoxic lutenizing hormone-releasing hormone analogue
  by epidermal growth factor. Krebs, Linda J.; Wang, Xiaopeng; Pudavar,
  Haridas E.; Bergey, Earl J.; Schally, Andrew V.; Nagy, Attila; Prasad,
  Paras N.; Liebow, Charles (1). (1) Department of Chemistry, Institute for
  Lasers, Photonics, and Biophotonics, State University of New York, NSM
  Complex, Room 811, Buffalo, NY, 14260-3000 USA. Cancer Research, (August
  1, 2000) Vol. 60, No. 15, pp. 4194-4199. print. ISSN: 0008-5472. Language:
  English. Summary Language: English.
- Targeting chemotherapy selectively to cancers can reduce the toxic side AΒ effects. AN-152, a conjugate of doxorubicin and (D-Lys6)-luteinizing hormone-releasing hormone (LH-RH), is more potent against LH-RH receptor-bearing cancers and produces less peripheral toxicity than doxorubicin. Many cancers, e.g., 50% of breast cancers, but few normal tissues express these receptors, providing a selective target for this cytotoxic conjugate. In this study, the effectiveness of AN-152 was heightened by receptor up-regulation. The cytotoxic effect of AN-152 can be regulated by the number of active LH-RH receptors on cancer cells. LH-RH receptor-positive (MCF-7) and -negative (UCI-107) cancer cells were treated with epidermal growth factor (EGF) or the somatostatin analogue, RC-160. EGF and RC-160 have been shown previously to regulate LH-RH receptors through phosphorylation. The effect of receptor regulation, by hormone exposure, on the cytotoxicity of AN-152 and doxorubicin and on the cellular uptake of AN-152, (D-Lys6)LH-RH, or doxorubicin was assessed by the 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide assay and by two-photon laser scanning microscopy. The results demonstrated that the cellular entry of the conjugate was: (a) specific for cancers with LH-RH receptors; (b) up-regulated by EGF; (c) down-regulated by RC-160; and (d) the cytotoxicity of the AN-152 paralleled the efficiency of entry. This study illustrates the potential use of receptor regulation for increasing the efficacy of chemotherapeutic approaches that are directed to cell surface receptors.

- L4 ANSWER 6 OF 22 CAPLUS COPYRIGHT 2002 ACS
- 2000:82250 Document No. 132:202765 Stability of cytotoxic luteinizing hormone-releasing hormone conjugate (AN-152) containing doxorubicin 14-O-hemiglutarate in mouse and human serum in vitro: implications for the design of preclinical studies. Nagy, Attila; Plonowski, Artur; Schally, Andrew V. (Endocrine, Polypeptide, and Cancer Institute, Veterans Affairs Medical Center and Section of Experimental Medicine, Department of Medicine, Tulane University School of Medicine, New Orleans, LA, 70112-2699, USA). Proc. Natl. Acad. Sci. U. S. A., 97(2), 829-834 (English) 2000. CODEN: PNASA6. ISSN: 0027-8424. Publisher: National Academy of Sciences.
- Recently, the authors developed a series of cytotoxic peptide conjugates AB contg. 14-O-glutaryl esters of doxorubicin (DOX) or 2-pyrrolino-DOX (AN-201). Serum carboxylesterase enzymes (CE) can partially hydrolyze these conjugates in the circulation, releasing the cytotoxic radical, before the targeting is complete. CE activity in serum of nude mice is about 10 times higher than in human serum. Thus, the authors found that the t1/2 of AN-152, an analog of LH-releasing hormone (LH-RH) contg. DOX, at 0.3 mg/mL is 19.49.+-.0.74 min in mouse serum and 126.06.+-.3.03 min in human serum in vitro. The addn. of a CE inhibitor, diisopropyl fluorophosphate (DFP), to mouse serum in vitro significantly (P < 0.01) prolongs the t1/2 of AN-152 to 69.63.+-.4.44 min. When DFP is used in vivo, 400 nmol/kg cytotoxic somatostatin analog AN-238 contg. AN-201 is well tolerated by mice, whereas all animals die after the same dose without DFP. In contrast, DFP has no effect on the tolerance of AN-201. A better tolerance to AN-238 after DFP treatment is due to the selective uptake of AN-238 by somatostatin receptor-pos. tissues. The authors' results demonstrate that the suppression of the CE activity in nude mice greatly decreases the toxicity of cytotoxic hybrids contg. 2-pyrrolino-DOX 14-O-hemiglutarate and brings this animal model closer to the conditions that exist in humans. The use of DFP together with these peptide conjugates in nude mice permits a better understanding of their mechanism of action and improves the clin. predictability of the oncol. and toxicol. results.

- 2000:655963 Document No. 134:21361 Oral absorption of peptides through the cobalamin (Vitamin B12) pathway in the rat intestine. Alsenz, Jochem; Russell-Jones, Greg J.; Westwood, Steven; Levet-Trafit, Bernard; De Smidt, P. Chris (Preclinical Research Department, Pharma Division, F. Hoffmann-La Roche Ltd., Basel, CH-4070, Switz.). Pharmaceutical Research, 17(7), 825-832 (English) 2000. CODEN: PHREEB. ISSN: 0724-8741. Publisher: Kluwer Academic/Plenum Publishers.
- This study was aimed at examg. the extent and mechanism of uptake of AB cobalamin (Cbl)-conjugated peptides in vitro and in vivo. To enable acquisition of quant. absorption data of Cbl-peptides, metabolically stable octapeptides (DP3), with (Cbl-Hex-DP3) or without a hexyl spacer (Cb1-DP3), were coupled to Cb1 and radiolabeled. For comparison, LHRH coupled to Cbl was used as metabolically susceptible peptide. Biol. recognition of Cbl-peptides was studied in the physiol. order: binding by Intrinsic Factor (IF), recognition and transport of the IF-complexes by IF-Cbl receptors (IFCR) on Caco-2 monolayers and oral absorption of the Cbl-conjugates in the rat. All Cbl-peptides bound to IF and the IF-complexes were recognized by IFCR receptors on Caco-2 monolayers. Binding was saturable and could be inhibited by a 20-fold excess of IF-Cbl, but not of Non-intrinsic Factor (NIF)-Cbl. Oral administration of these ligands to rats resulted in absorption of 53%, 45%, 42%, and 23% of the applied radioactivity for Cbl, Cbl-LHRH, Cbl-Hex-DP3, and Cbl-DP3, resp. Simultaneous administration of a > 105-fold excess of unlabeled Cbl reduced uptake of all compds. to < 4%. Tissue distribution and elimination of the metabolically stable Cbl-conjugates were comparable to Cbl. The endogenous Cbl uptake pathway can be exploited for oral peptide delivery as indicated by the specific and high (40-45%) uptake of metabolically stable Cbl-coupled octapeptides.

Human prostate and breast tumor cells produce LH-releasing hormone (LHRH) AΒ receptors on their cell surface even when they have lost dependency on sex steroid hormones for growth. To investigate whether LHRH can be used as a cell-binding moiety to deliver toxin mols. into prostate and breast tumor cells, LHRH-bovine RNase A conjugates were constructed using the chem. crosslinking method. The treatment of the LHRH receptor-pos. cells such as prostate LNCapFGC and breast MCF7 tumor cells with LHRH-RNase A conjugates resulted in a dose-dependent inhibition of growth. The cytotoxic activities of these conjugates were effectively reduced by the presence of exogenous LHRH. Either free RNase A or LHRH alone did not affect the proliferation of these cells. The LHRH-RNase A conjugates did not show cytotoxicity against FRTL5 and TM4 cells which do not express the LHRH receptors. These results suggest that LHRH can be used as a cell-binding mol. for the specific delivery of toxin mols. into the cells which express LHRH receptors on their surface. Thus, a new class of biomedicines that act as fusion proteins between LHRH and toxins will give us a new avenue for the treatment of human prostate and breast cancers, regardless of their steroid hormone dependency.

One way to enhance the efficiency of hormone-dependent tumors treatment is AB the prepn. of hybrid compds. incorporating a cytotoxic agent and a peptide hormone capable of interacting with the cancer tissue, since it has corresponding receptors. This approach permits decreasing of the chemotherapeutic agent doses and, as a result, it's toxicity. On the other hand, it could escape the complications related to the possibility of tumor repopulation caused by the presence of hormone-independent cells. This work is devoted to the investigation of the LH-RH analogs' application as biospecific carrier for the cytotoxic drugs. The authors have synthesized a no. of LH-RH analogs R-Pro-D-Phe-Pro-Ser-Tyr-D-Lys(R1)-Leu-Arg-Pro-Gly-NH2 [I; R = H = H; R = Ac and R1 = H; R = palmitoyl, R1 = RH; R = Ac, R1 = Q; R = R1 = Q; R = palmitoyl, R1 = Q] modified by a widely used anticancer agent 5-fluorouracil (5-FU) and/or the palmitoyl group (Pam). The latter modification is thought to be responsible for the modulation of peptide interaction with cell membrane. The structure of these substances is based on the sequence of LH-RH analog I (R = R1 = H)that possess high antitumor activity in the prostate cancer model (84% of the tum-our growth inhibition in a dose of 100 Vg/kg). The synthesis was

provided by the solid phase method on the MBHA resin with using of the Boc/Bzl strategy. 5-FU was introduced into the peptide structure in the form of ONp-ester of its 1-carboxymethyl deriv. (CMFU). Pam-Pro was attached by the std. solid phase procedure. All modified peptides exhibited significant inhibition of tumor growth in expts. in vivo on Aci rats bearing prostate tumors. The better antineoplastic properties in this cancer model was demonstrated by the peptide I (R = Pam, R1 = Q) (54-67% of the tumor growth inhibition in a wide dose range: 0.1-100 pg/kg). The compd. is considered to be active if the EC50 (measured by the method of 3H-thymidine incorporation) is less then 104 M. In order to increase the cytotoxic agent loading the authors have synthesized the macromol. compd. (conjugate 1) contg. 5-FU and peptide I (R = R1 = H) on the basis of poly-(N-vinylpyrrolidone-co-crotonic acid) (85:15; MWv = 30 000). Also, the authors have synthesized control polymers incorporating 5-FU or the LH-RH analog I (R = R1 = H), alone as well as the polymer with 5-FU and fibrinogen fragment (control substance 1, 2, and 3, resp.). The influence of these conjugates and LH-RH analogs I (R = R1 = H), I (R = R) Pam, R1 = H) and I (R = Pam, R1 = Q) on proliferation of the human carcinoma cell line which contains the LH-RH receptors, were tested in vitro. Nonmodified LH-RH analog I (R = R1 = H) was not active in vitro, whereas the peptides with the Pam residues I (R = Pam, R1 = H) and I (R = Pam) Pam, R1 = Q) had a direct influence on proliferation of this cell line. The only conjugate contg. both LH-RH analog and 5-FU (7) exhibited cytotoxic activity among the synthesized polymers. All control substances 1, 2, and 3 were not efficient. This fact suggests the receptor-mediated internalization of the macromol. hybrid compd. into tumor cells and the realization of the 5-FU cytotoxic capacity. The authors suppose the use of LH-RH analogs as biospecific carrier for targeting of chemotherapeutic agents to be a promising approach to the therapy of prostate, breast, ovary, pituitary, and other hormone-dependent tumors.

Immunol., New Delhi, 110067, India). J. Reprod. Immunol., 19(2), 197-207 (English) 1991. CODEN: JRIMDR. ISSN: 0165-0378.
- As a vaccine against the gonadotropin-releasing hormone (GnRH) is being developed as an immunol. method for the treatment of prostatic enlargement. The influence of the genetic back-ground on immune responses to GnRH conjugated to diphtheria toxoid (DT) was investigated. Mice of different strains were injected with the conjugate and the antibody levels against GnRH and DT quantitated in order to examine the effect of genetic background on immune responses to the hapten and the carrier. All immunized animals produced antibodies to DT. Anti-GnRH antibodies were generated by all strains of mice except 129. The low anti-GnRH response in the 129 strain mice did not appear to be MHC-linked, as C57BL/6 mice, which bear the same MHC haplotype as 129 mice, were able to generate a strong anti-GnRH response. The non-responsiveness to the hapten (GnRH) in 129 strain mice was overcome by the use of an "alternate carrier" approach.

- AB A compn. for the prodn. in animals of antibodies specific for LH-RH comprises .gtoreq.2 different carriers coupled to LH-RH or its analogs in amts. sufficient to elicit an immune response against LH-RH. The compns. are used to suppress male social and sexual behavior and female estrus cyclicity and ovulation in domestic animals. Merino ram lambs were immunized with a mixt. of LH-RH-tetanus toxoid, LH-RH-staphylococcal protein A, and LH-RH-keyhole limpet hemocyanin conjugates (carbodiimide-coupled) in Freund's complete adjuvant with booster injections of the conjugates in Freund's incomplete adjuvant. All the lambs tested gave a substantial immune response with a mean titer of 1:5146 and a titer range of 1:600 to 1:20,000, whereas none of the lambs immunized with carrier protein alone showed any immune response and lambs immunized with single LH-RH conjugates gave variable results in both antibody titer and the no. of animals responding.

- Immunization of female rats with a bovine serum albumin-luteinizing hormone releasing hormone conjugate results in suppression of dimethylbenzanthracene mammary tumor incidence. Tumor incidence was 1.3, and 1.29 tumors per rat in bovine serum albumin alone (n=10) and unimmunized (n=18) control groups, but no tumors were found in the bovine serum albumin-luteinizing hormone releasing hormone conjugate immunized animals (n=10). In a second experiment immunization with bovine serum albumin-luteinizing hormone releasing hormone conjugates reduced tumor incidence to 0.3 tumors per rat (n=10) from the 1.2 tumors

THIS PAGE BLANK

per animal seen in the control animals (n = 10) immunized with bovine serum albumin alone. Bovine serum albumin-luteinizing hormone immunization caused the production of anti-LHRH antibodies, an interruption of estrous cycles, lowered serum estradiol and progesterone levels, and atrophy of the ovaries and uteri. Immunization BSA-hormone conjugates is a novel anti-tumor strategy.

CODEN: AAJID6. Pub. Country: United States. Language: English.

Antibody response to the decapeptide luteinizing hormone-releasing hormone (LHRH) was induced in mice without use of Freund's complete adjuvant. The conventionally employed conjugates of LHRH with bovine serum albumin were poor immunogens and required potent adjuvants. In contrast, LHRH linked covalently to tetanus toxoid or keyhole limpet hemocyanin-generated antibodies with alum as adjuvant. Methods are described for preparation of LHRH conjugates with these carrier proteins with defined molar composition.

PubMed ID: 8904700. castration method and the provision of local anesthesia on plasma cortisol, scrotal circumference, growth, and feed intake of bull calves. Fisher A D; Crowe M A; Alonso de la Varga M E; Enright W J. (Teagasc, Grange Research Centre, Dunsany, Co. Meath, Ireland. ) JOURNAL OF ANIMAL SCIENCE, (1996 Oct) 74 (10) 2336-43. Journal code: HC7; 8003002. ISSN: 0021-8812. Pub. country: United States. Language: English. To determine the effects of castration of calves, with or without local AB anesthesia, on plasma cortisol, scrotal circumference, ADG, and ADFI, 56 Friesian bulls (5.5 mo of age; mean +/- SE BW = 173 +/- 2 kg) were randomly assigned to each of seven treatments: 1) control (CON); 2) s.c. injection of .1 mg of a human serum albumin-GnRH conjugate with DEAE-dextran adjuvant (HSA-GnRH); 3) burdizzo castration without local anesthetic (BURD); 4) burdizzo castration following local anesthetic administration (BURD + LA); 5) surgical castration without local anesthetic (SURG); 6) surgical castration following local anesthetic administration (SURG + LA); and 7)

local anesthetic administration alone (LAA). Blood samples for cortisol analyses were taken via jugular catheter from -2 to 10 h and at 24, 48,

and 72 h relative to treatment. Average daily feed intakes were recorded for 5-d periods and calves weighed at 7-d intervals before and after treatment. Local anesthetic alone had no effect (P > .10) on any variable. The HSA-GnRH calves had elevated (P < .05) plasma cortisol from 2 to 6 h compared with CON calves. Peak plasma cortisol was elevated (P < .01) in BURD, BURD + LA, SURG, and SURG + LA compared with CON calves. The SURG calves (46.0 ng/mL) had higher (P < .03) peak cortisol than BURD (31.4 ng/mL) and SURG + LA (35.4 ng/mL) calves. There was no difference in peak cortisol between BURD and BURD + LA (26.5 ng/mL) calves. The ADG from d 0 to 7 was reduced (P < .05) in calves in BURD + LA, SURG, and SURG + LA treatments (-.01, -.83 and -.24 kg, respectively) compared with CON calves (.54 kg). The ADFI were reduced (P < .05) in BURD and BURD + LA calves during d 1 to 5 and in BURD + LA, SURG, and SURG + LA calves during d 6 to 10 compared with CON calves. The scrotal circumferences of BURD and BURD + LA calves were greater (P < .05) than those of CON calves for 7- and 35-d periods post-castration, respectively. Castration induced increases in cortisol and decreases in ADG and ADFI. Surgical castration induced a greater plasma cortisol response than burdizzo castration, and the administration of local anesthetic reduced the cortisol response of surgical castrates but was less effective for burdizzo castrates.

## L5 ANSWER 2 OF 3 MEDLINE

- PubMed ID: 8617674. Immunization of 96204047 Document Number: 96204047. prepubertal beef heifers against gonadotropin-releasing hormone: immune, estrus, ovarian, and growth responses. Prendiville D J; Enright W J; Crowe M A; Vaughan L; Roche J F. (Teagasc, Grange Research Centre, Dunsany, Co. Meath, University College Dublin, Ballsbridge, Ireland. ) JOURNAL OF ANIMAL SCIENCE, (1995 Oct) 73 (10) 3030-7. Journal code: HC7; 8003002. ISSN: 0021-8812. Pub. country: United States. Language: English. To develop an effective immunization protocol against human serum AB albumin-Cys-Gly-GnRH (HSA-GnRH) conjugate to delay the onset of puberty in heifers, 58 heifers (8 mo of age; mean +/- SE BW = 203 +/- 1 kg) were randomly assigned to each of six treatments: 1) controls, .1 mg of HSA, with diethylaminoethyl (DEAE) -dextran as adjuvant, on d 0 and 28; 2) .1 mg of HSA-GnRH, with DEAE-dextran, on d 0; 3) as 2) and booster on d 28; 4) as 3) but boosters also on d 84, 140, 196, and 252; 5) as 2) but half the conjugate given with DEAE -dextran adjuvant and half with non-ulcerative Freund's adjuvant (NUFA), injected in two separate sites; and 6) as 2) but the conjugate given with DEAE-dextran and NUFA, emulsified and injected in two sites. The duration of the experiment was 342 d. Mean plasma GnRH antibody titers (samples every 2 wk) for heifers in Treatments 2 to 6 were 9.4  $\pm$  1.16, 20.6 + /- 2.21, 43.9 + /- 2.86, 27.9 + /- 2.67, and 44.5 + /- 3.75% binding at a plasma dilution of 1:640. The mean number of times estrus was observed in heifers was less (P < .05; pooled SEM = .53) in Treatments 4 (.2) and 6 (2.4) than in Treatments 1, 2, 3, and 5 (7.8, 7.0, 7.0, and 6.6, respectively). The mean interval to the onset of puberty (the first increase in plasma progesterone > or = .5 ng/mL for > or = 10 d with samples at 3- to 4-d intervals) was greater (P < .05; pooled SEM = 11.6) for heifers in treatments 4 (339 d) and 6 (276 d) than for heifers in Treatments 1, 2, 3, and 5 (164, 159, 165, and 170 d, respectively). Mean ADG of heifers was reduced (P < .05) in treatments 2, 3, 4, and 6 (.71, .72, .68, and .69 kg, respectively) compared with controls (.77). In summary, the multiple booster immunization treatment induced and maintained sufficient anti-GnRH titer to delay puberty for 175 d; a single immunization against GnRH with DEAE and NUFA increased antibody titers enough to delay puberty for 112 d. However, GnRH immunization treatments reduced ADG of heifers in Treatments 2, 3, 4, and 6.

  96008063 Document Number: 96008063. PubMed ID: 8567476. Immunization of heifers against gonadotropin-releasing hormone: antibody titers, ovarian function, body growth, and carcass characteristics. Prendiville D J; Enright W J; Crowe M A; Finnerty M; Hynes N; Roche J F. (Teagasc, Grange

Research Centre, Dunsany, Co. Meath, Dublin, Ireland. ) JOURNAL OF ANIMAL SCIENCE, (1995 Aug) 73 (8) 2382-9. Journal code: HC7; 8003002. ISSN: 0021-8812. Pub. country: United States. Language: English. To investigate the effects of active immunization of cyclic beef heifers AΒ with different doses of a human serum albumin-Cys-Gly-GnRH (HSA-GnRH) conjugate on antibody titers, ovarian function, body growth, and carcass characteristics, 32 heifers (BW = 477 +/- 7.1 kg; mean +/- SE) were assigned to one of four immunization treatments: .1 mg of HSA or .01, .1, or 1.0 mg of HSA-GnRH, respectively. All heifers received a primary (d 0) and booster (d 28) immunization using DEAE-dextran as adjuvant. The duration of the experiment was 158 d. Overall antibody titers against GnRH were greater (P < .05) for heifers immunized against GnRH (13  $\pm$ /- 3.3, 22  $\pm$ /- 3.8, and 19  $\pm$ /- 2.8% binding at a plasma dilution of 1: 640 for Treatments 2 to.4, respectively) than for controls (1 +/- .1%). The numbers of heifers that became anestrous (plasma progesterone < .5 ng/mL for > 21 d) were 1/8, 8/8, 7/8, and 8/8, respectively. The interval from primary immunization to anestrus (40.7 +/-6 d) and the duration of anestrus (78 + / - 7 d) were not affected by dose of HSA-GnRH conjugate. The number of ovulations detected was reduced (P < .05) in GnRH-immunized (4.6 +/- .64, 4.0 +/-.70, and 3.6  $\pm$ /- .60 for Treatments 2 to 4, respectively) compared with control heifers (9.4 +/- .20). During induced anestrus, follicular growth was generally arrested (< 5 mm in diameter) and plasma estradiol decreased. DUPLICATE 1 MEDLINE ANSWER 1 OF 20 L3 PubMed ID: 11672903. 2001567657 Document Number: 21530443. The role of the individual amino acids of a GnRH-tandem-dimer peptide used as an antigen for immunocastration of male piglets determined with systematic alanine replacements. Turkstra J A; Oonk H B; Schaaper W M; Meloen R H. (ID-Lelystad, Institute for Animal Science and Health, Edelhertweg 15, 8219 PH Lelystad, The Netherlands.. j.a.turkstra@id.wag-ur.nl) . VACCINE, (2001 Nov 12) 20 (3-4) 406-12. Journal code: 8406899. ISSN: 0264-410X. Pub. country: England: United Kingdom. Language: English. Immunocastration targeting gonadotropin releasing hormone (GnRH) can be AB obtained in male piglets using native GnRH conjugates.

obtained in male piglets using native **GnRH conjugates**. However, due to insufficient efficacy of these conjugates, improved GnRH antigens, like peptides existing of repeats of the GnRH amino acid sequence, have been designed. We previously reported about a dimerised GnRH-tandem peptide with a D-Lys at position 6 of the native GnRH sequence (G6k-TD) being highly effective. To evaluate the contribution of each individual amino acid of the GnRH decapeptide to the efficacy of the G6k-TD peptide, each amino acid was replaced consecutively by alanine (Ala-scan). The G6k-TD peptides were conjugated to ovalbumin, used for immunisation and tested for their ability to elicit GnRH antibodies and to

immunocastrate male piglets. The results show that four out of nine amino acids (pGlu-1, Ser-4, Arg-8 and Gly-10) can be replaced by alanine without negatively affecting immunocastration efficacy. Replacement of amino acids in other positions (Tyr-5, Leu-7 and Pro-9) gave partial decrease of efficacy, respectively, five, six and six out of seven piglets were immunocastrated. Replacements at two other positions (His-2 and Trp-3) completely negated immunocastration activity. Thus, seven out of nine amino acid positions in the basic unit of G6k-TD can be substituted by alanine without affecting immunocastration efficacy.

- In an attempt to develop an efficient chemotherapeutic agent targeted at AΒ malignant cells that express receptors to gonadotropin releasing hormone (GnRH) we coupled [D-Lys6]GnRH covalently to an emodin derivative, i.e. emodic acid (Emo) to yield [D-Lys6(Emo)]GnRH. Emodin is a naturally occurring anthraquinone which is widely used as a laxative and has other versatile biological activities. Physico-chemical studies employing electron paramagnetic resonance and electrochemistry of the conjugate as well as the (Emo) moiety showed that these compounds could be easily reduced either chemically, photochemically or enzymatically to their corresponding semiquinones. In the presence of oxygen the semiquinones generated reactive oxygen species (ROS), mainly superoxide and hydroxyl radicals, which were detected by the spin trapping method. Moreover, upon irradiation with visible light these compounds produced ROS and a highly reactive excited triplet state of Emo, which by itself may cause the oxidation of certain electron acceptors such as amino acids and bases of nucleic acids. Thus, [D-Lys6]GnRH-photosensitizer conjugates may be potentially used for targeted photodynamic chemotherapy aimed at treating cancer cells that carry GnRH receptors. These conjugates may also induce cytotoxicity in the dark similar to common conventional chemotherapeutic agents. The peptidic moiety, [D-Lys6]GnRH, was found to be stable toward highly reactive ROS generated either from enzymatic reduction or upon photoirradiation. The physico-chemical properties of Emo were only marginally influenced by the peptidic [D-Lys6] GnRH carrier.

- The effect of various GnRH analogues, and their conjugates on proliferation, clonogenicity and cell cycle phase distribution of MCF-7 and Ishikawa human cancer cell lines was studied. GnRH-III, a sea lamprey GnRH analogue reduced cell proliferation by 35% and clonogenicity by 55%, Structural modifications either decreased, or did not alter biological

activity. Conjugation of GnRH analogues including MI-1544, MI-1892, and GnRH-III with poly(N-vinylpyrrolidone-co-maleic acid) (P) through a tetrapeptide spacer GFLG(X) substantially increased the inhibitory effect of the GnRH analogues. The conjugate P-X-GnRH-III induced significant accumulation of cells in the G2/M phase; from 8% to 15.6% at 24 h and 9.8% to 15% at 48 h. It was concluded that conjugation of various GnRH analogues substantially enhanced their antiproliferative activity, strongly reduced cell clonogenicity and retarded cell progression through the cell division cycle at the G2/M phase.

- Pub. country: Hungary. Language: English. We developed a group of synthetic analogs of GnRH and Somatostatin to inhibit the tumor growth of different kind. The GnRH analogs decreasing the gonadotroph and steroid hormone levels act on the hormone dependent tumors and influence their growth. One of the most effective antitumor analog was patented under the name FOLLIGEN which inhibited the breast cancer caused by DMBA in rats without any side-effects. Other inhibitory analogs of GnRH with long-lasting effect were effective in the treatment of breast, ovary and prostate tumors. Another analog [alpha-Asp(DEA)]6,Gln8-hGnRH showed a very low endocrine but high antitumor effect in both in vitro and in vivo experiments. Its tritium labeled derivative exhibited specific binding sites on human tumor cell lines. We synthesized the analogs of GnRH-III with effective selective antitumor activity which does not alter the ovarian cycle of rats but inhibits the colony-formation of human breast cancer cell lines and has a significant antiproliferative effect. We also synthesized conjugates of potent GnRH analogs with a branched chain polylysine backbone which induce a 33-35% decrease of cell numbers of MCF-7 and MDA-MB-231 human breast cancer cell lines and 45-50% inhibition of cell proliferation. Another conjugate decreased the tumor growth of MDA-MB-231 xenografts by 80% in a treatment of 9 weeks and even tumor free animals could be found among the ones treated. Using these radiolabeled peptide hormone analogs we found that human tumor cell lines and xenografts specifically bind the GNRH conjugates. We also synthesized a series of Somatostatin analogs which inhibit tyrosine kinases and the growth of several breast, prostate and colon tumor cell lines. One of our best analogs was a heptapeptide, TT-232, which strongly inhibited the tyrosine kinase activity and the cell-proliferation in different colon tumor cells. However, it did not inhibit the growth hormone release either in vitro or in vivo from rat pituitary cells. The TT-232 was found to be effective on 60 human tumor cell lines, it significantly inhibited the tumor growth on different animal tumor models, and induced apoptosis, as a result of which some animals became tumor free. The TT-232 inhibited the tumor growth of PC3 prostate xenografts with 60% and caused a 100% survival of mice 60 days after the transplantation. It is being preclinically tested at present. We have shown that the new GnRH analogs acting without any hormonal effect and the Somatostatin analogs with strong antitumor and tyrosine kinase inhibitory activity but no hormonal effect may represent a breakthrough in the research of the antitumor peptides, having direct effect on tumor cells.

Society for Neuroscience. ISSN: 0190-5295. Language: English. Summary Language: English.

Antennapedia-derived vector peptides (Antp-vp) efficiently carry cargo AB molecules into cells without using specific carriers or receptors. One hypothesis for the mechanism of vector peptide delivery states that vector peptides aggregate on the surface of the cell membrane prior to internalization (Derossi et.al., J. Biol. Chem. 269: 10444-50, 1994). Therefore, we wanted to assess whether multimeric forms of Antp-vectors linked to neuropeptide cargoes would exhibit increased internalization. Previously, we demonstrated that branched coupling via lysine side chains between Antp-vp and GnRH analogs resulted in increased potency of the GnRH moiety. In this study, we compared monomeric, dimeric, and trimeric (Antp-vp)-GnRH branched conjugates to determine if multimerization had any effect on the internalization and bioactivity of the GnRH cargoes. Dimerization of branched (Antp-vp)-GnRH peptides was accomplished by creating disulfide linkages between the cysteine residues on the vector peptides. Trimeric conjugates were synthesized by cross-linking monomers with tris-(2-maleimidoethyl)amine, a novel trivalent reagent. Conjugate formation was confirmed by a combination of HPLC, amino acid analyses, and mass spectrometry. Bioactivity was assessed by measuring conjugate-induced LH release from dispersed rat pituitary cells. Results demonstrated appreciable LH release by these multimeric compounds. However, the formation of multimeric forms of (Antp-vp)-GnRH significantly reduced the efficiency of internalization of the GnRH cargoes. (Study funded by a grant from the Texas Higher Education Coordinating Board Advanced Research Program.)

  P. Kluwer: Dordrecht, Neth. (English) 1999. CODEN: 67UCAR.
- The direct antitumor activity of GnRH-III in vivo is increased by AΒ conjugation to poly(N-vinylpyrrolidone-co-maleic acid) (P) (mol. wt. c.a. 10,000) through a GFLG tetrapeptide spacer (X). To examine the biodistribution and clearance of the conjugates and components thereof, the following radiolabeled derivs. were prepd.: carboxyl groups (2%) of P were coupled with 125I-tyrosylamide before conjugation through (X) with GnRH-III to form 125I-tyrosylamide-P-X-GnRH-III, and [3H]GnRH-III was conjugated with P-X to form P-X-[3H]GnRH-III. Compds. were injected s.c. into CBA/CA mice with MCF-7 human breast cancer xenografts. In general, the results show that, conjugation of GnRH-III with the copolymer favors tissue retention of intact bound peptide. Conjugation apparently affords protection from proteolytic degrdn. in blood circulation, whereas the free peptide resembles polypeptide hormones of comparable size in that it is readily cleared. This may contribute to the superior antitumor effects of conjugates in vivo.

The conjugates are administered to male and female animals to sterilize said animals or to reduce tumors that require sex steroids for growth. The instant conjugates are therefore useful as sterilizing agents and anticancer agents. Thus, GnRH analog H-pGlu-His-Tyr-Ser-D-Lys(R)-Leu-Arg-Pro-Gly-NH2 (II; R = H) (solid-phase prepn. given) reacted with .beta.-maleimidopropionic acid N-hydroxysuccinimide ester to give adduct II (R = 3-maleimidopropyl). Reduced Pseudomonas exotoxin PE38QQR was then conjugated to adduct II (R = 3-maleimidopropyl).
- MEDLINE DUPLICATE 4 ANSWER 10 OF 20 97060654 Document Number: 97060654. PubMed ID: 8904700. Effect of castration method and the provision of local anesthesia on plasma cortisol, scrotal circumference, growth, and feed intake of bull calves. Fisher A D; Crowe M A; Alonso de la Varga M E; Enright W J. (Teagasc, Grange Research Centre, Dunsany, Co. Meath, Ireland. ) JOURNAL OF ANIMAL SCIENCE, (1996 Oct) 74 (10) 2336-43. Journal code: HC7; 8003002. ISSN: 0021-8812. Pub. country: United States. Language: English.

To determine the effects of castration of calves, with or without local AB

anesthesia, on plasma cortisol, scrotal circumference, ADG, and ADFI, 56 Friesian bulls (5.5 mo of age; mean +/- SE BW = 173 +/- 2 kg) were randomly assigned to each of seven treatments: 1) control (CON); 2) s.c. injection of .1 mg of a human serum albumin-GnRH conjugate with DEAE-dextran adjuvant (HSA-GnRH); 3) burdizzo castration without local anesthetic (BURD); 4) burdizzo castration following local anesthetic administration (BURD + LA); 5) surgical castration without local anesthetic (SURG); 6) surgical castration following local anesthetic administration (SURG + LA); and 7) local anesthetic administration alone (LAA). Blood samples for cortisol analyses were taken via jugular catheter from -2 to 10 h and at 24, 48, and 72 h relative to treatment. Average daily feed intakes were recorded for 5-d periods and calves weighed at 7-d intervals before and after treatment. Local anesthetic alone had no effect (P > .10) on any variable. The HSA-GnRH calves had elevated (P < .05) plasma cortisol from 2 to 6 h compared with CON calves. Peak plasma cortisol was elevated (P < .01) in BURD, BURD + LA, SURG, and SURG + LA compared with CON calves. The SURG calves (46.0 ng/mL) had higher (P < .03) peak cortisol than BURD (31.4 ng/mL) and SURG + LA (35.4 ng/mL) calves. There was no difference in peak cortisol between BURD and BURD + LA (26.5 ng/mL) calves. The ADG from d 0 to 7 was reduced (P < .05) in calves in BURD + LA, SURG, and SURG + LA treatments (-.01, -.83 and -.24 kg, respectively) compared with CON calves (.54 kg). The ADFI were reduced (P < .05) in BURD and BURD + LA calves during d 1 to 5 and in BURD + LA, SURG, and SURG + LA calves during d 6 to 10 compared with CON calves. The scrotal circumferences of BURD and BURD + LA calves were greater (P < .05) than those of CON calves for 7- and 35-d periods post-castration, respectively. Castration induced increases in cortisol and decreases in ADG and ADFI. Surgical castration induced a greater plasma cortisol response than burdizzo castration, and the administration of local anesthetic reduced the cortisol response of surgical castrates but was less effective for burdizzo castrates.

DUPLICATE 5 MEDLINE ANSWER 11 OF 20 L3 97367851 Document Number: 97367851. PubMed ID: 9227921. Normal or induced secretory patterns of luteinising hormone and follicle-stimulating hormone in anoestrous gonadotrophin-releasing hormone-immunised and cyclic control heifers. Prendiville D J; Enright W J; Crowe M A; Finnerty M; Roche J F. (Teagasc, Grange Research Centre, Dunsany, Co. Meath, Ireland. ) ANIMAL REPRODUCTION SCIENCE, (1996 Dec 16) 45 (3) 177-90. Journal code: CV3; 7807205. ISSN: 0378-4320. Pub. country: Netherlands. Language: English. The objective was to determine the effect of gonadotrophin-releasing AB hormone (GnRH), GnRH analogue (GnRH-A) or oestradiol administration on luteinising hormone (LH) and follicle-stimulating hormone (FSH) release in GnRH-immunised anoestrous and control cyclic heifers. Thirty-two heifers (477 +/- 7.1 kg) were immunised against either human serum albumin (HSA; controls; n = 8), or a HSA-GnRH conjugate. On day 70 after primary immunisation, control heifers (n = 4 per treatment; day 3 of cycle) received either (a) 2.5 micrograms GnRH or (b) 2.5 micrograms of GnRH-A (Buserelin) and GnRH-immunised heifers (blocked by GnRH antibody titre; n = 6 per treatment) received either (c) saline, (d) 2.5 micrograms GnRH, (e) 25 micrograms GnRH or (f) 2.5 micrograms GnRH-A, intravenously. On day 105, 1 mg oestradiol was injected (intramuscularly) into control (n = 6) and GnRH-immunised anoestrous heifers with either low (13.4  $\pm$  1.9% binding at 1:640; n = 6) or high GnRH antibody titres (33.4 +/- 4.8%) binding; n = 6). Data were analysed by ANOVA. Mean plasma LH and FSH concentrations on day 69 were higher (P < 0.05) in control than in GnRH-immunised heifers (3.1 +/-  $\overline{0}$ .16 vs. 2.5 +/- 0.12 ng LH ml-1 and 22.5 +/- 0.73 vs. 17.1 +/- 0.64 ng FSH ml-1, respectively). The number of LH pulses was higher (P < 0.05) in control than in GnRH-immunised heifers on day 69 (3.4 +/- 0.45 and 1.0 +/- 0.26 pulses per 6 h, respectively). On day 70, 2.5 micrograms GnRH increased (P < 0.05) LH concentrations in control but not in GnRH-immunised heifers, while both 25 micrograms GnRH and 2.5 micrograms GnRH-A increased (P < 0.05) LH concentrations in GnRH-immunised heifers, and 2.5 micrograms GnRH-A increased LH in

controls. FSH was increased (P < 0.05) in GnRH-immunised heifers following 25 micrograms GnRH and 2.5 micrograms GnRH-A. Oestradiol challenge increased (P < 0.05) LH concentrations during the 13-24 h period after challenge with a greater (P < 0.05) increase in control than in GnRH-immunised heifers. FSH concentrations were decreased (P < 0.05) for at least 30 h after oestradiol challenge. In conclusion, GnRH immunisation decreased LH pulsatility and mean LH and FSH concentrations. GnRH antibodies neutralised low doses of GnRH (2.5 micrograms), but not high doses of GnRH (25 micrograms) and GnRH-A (2.5 micrograms). GnRH immunisation decreased the rise in LH concentrations following oestradiol challenge.

- The aim of the study was to test in vivo the gonadotropin-releasing AΒ hormone (GnRH) antagonists and their conjugates showing antitumor activities in vitro. The in vivo experiments with the human GnRH antagonist MI-1544 (Ac-D-Trp(1,3),D-Cpa(2),D-Lys(6),D-Ala(10))-GnRH the chicken GnRH antagonist MI-1892 (Ac-D-Trp(1,3),D-Cpa(2),Lys(5),/beta-Asp(DEA)/(6). Gln(8),D-Ala(10))-GnRH, and their copolymer conjugates were carried out on MCF-7 and MDA-MB-231 human breast tumors xenografted in immunosuppressed CBA/Ca HRIJ-T6 female mice and on MXT mouse mammary tumor in BDF1 mice. The P-X-1544 and P-X-1892 conjugates were prepared by coupling the GnRH antagonists to macromolecule copolymer through biodegradable spacers. MI-1544 and its conjugate had strong, whereas MI-1892 and its conjugate had slight, castration effect in rats. All of them showed selective antitumor activity. The conjugates, given daily, inhibited both types of xenogratts by 42 to 49%. Their activity was stronger in MXT mammary tumor (72 to 61%). The in vivo effect of GnRH antagonists was largely increased by coupling them to nonbiodegradable macromolecule carriers of polyanionic character. P-X-1544 and P-X-1892 GnRH antagonist-macromolecule conjugates might become important therapeutic agents for the treatment of breast cancer.

- \*ABSTRACT IS AVAILABLE IN THE ALL AND IALL FORMATS\*

  The purpose of the present investigation was to develop new gonadotropin-releasing hormone (GnRH) antagonists and to increase their stability and antitumor effect by conjugation with carrier macromolecules. Antitumor effect was evaluated using clonogenic assay, cell counting for antiproliferation, and sulforhodamine B method. The presence of GnRH-binding sites in human cancer cell lines (MCF-7, MDA-MB-231, Ishikawa, LNCaP) was proved. The direct growth inhibition of tumor cell lines is achieved with relatively high analog concentrations (10(-10)-10(-5) M). We have developed new GnRH analogs of human and chicken origin. MI-1544 (Ac-D-Trp(1,3),D-Cpa(2),D-Lys(6),D-Ala(10))GnRH and the chicken GnRH antagonist MI-1892 (Ac-D-Trp(1,3),D-Cpa(2),Lys(5),[beta-Asp(DEA)](6),Gln(8),D-Ala(10))-GnRH have stronger direct antitumor properties than the agonists. The antagonists inhibited

proliferation of GnRH receptor-positive human cancer cell lines by 28 to 38%. GnRH peptide analogs were coupled with macromolecules through biodegradable groups, to enhance their antitumor effects. The antagonists reduced survival of MCF-7 and MDA-MB-231 cells by 38 to 48% and 20 to 41%, respectively. They showed less activity against human endometrial and prostate cancer cells (10-20%). The copolymer (P) as polyanionic carrier molecule reached only 15 to 20% survival reduction in all cell lines. However, the copolymer GnRH antagonist conjugates P-X-1892 and P-X-1544 killed 95 to 98% of cells at doses corresponding to the GnRH analog concentration. These compounds having antitumor activity could be tried for the treatment of prostate, breast, and endometrium cancer.

DUPLICATE 6 MEDLINE ANSWER 14 OF 20 Immunization of 96204047 Document Number: 96204047. PubMed ID: 8617674. prepubertal beef heifers against gonadotropin-releasing hormone: immune, estrus, ovarian, and growth responses. Prendiville D J; Enright W J; Crowe M A; Vaughan L; Roche J F. (Teagasc, Grange Research Centre, Dunsany, Co. Meath, University College Dublin, Ballsbridge, Ireland. ) JOURNAL OF ANIMAL SCIENCE, (1995 Oct) 73 (10) 3030-7. Journal code: HC7; 8003002. ISSN: 0021-8812. Pub. country: United States. Language: English. To develop an effective immunization protocol against human serum AΒ albumin-Cys-Gly-GnRH (HSA-GnRH) conjugate to delay the onset of puberty in heifers, 58 heifers (8 mo of age; mean +/- SE BW = 203 +/- 1 kg) were randomly assigned to each of six treatments: 1) controls, .1 mg of HSA, with diethylaminoethyl (DEAE)-dextran as adjuvant, on d 0 and 28; 2) .1 mg of HSA-GnRH, with DEAE-dextran, on d 0; 3) as 2) and booster on d 28; 4) as 3) but boosters also on d 84, 140, 196, and 252; 5) as 2) but half the conjugate given with DEAE-dextran adjuvant and half with non-ulcerative Freund's adjuvant (NUFA), injected in two separate sites; and 6) as 2) but the conjugate given with DEAE-dextran and NUFA, emulsified and injected in two sites. The duration of the experiment was 342 d. Mean plasma GnRH antibody titers (samples every 2 wk) for heifers in Treatments 2 to 6 were 9.4  $\pm$ /- 1.16, 20.6  $\pm$ /- 2.21, 43.9  $\pm$ /- 2.86, 27.9 +/- 2.67, and 44.5 +/- 3.75% binding at a plasma dilution of 1:640. The mean number of times estrus was observed in heifers was less (P < .05; pooled SEM = .53) in Treatments 4 (.2) and 6 (2.4) than in Treatments 1,  $\overline{2}$ , 3, and 5 (7.8, 7.0, 7.0, and 6.6, respectively). The mean interval to the onset of puberty (the first increase in plasma progesterone > or = .5 ng/mL for > or = 10 d with samples at 3- to 4-d intervals) was greater (P < .05; pooled SEM = 11.6) for heifers in treatments 4 (339 d) and 6 (276 d) than for heifers in Treatments 1, 2, 3, and 5 (164, 159, 165, and 170 d, respectively). Mean ADG of heifers was reduced (P < .05) in treatments 2, 3, 4, and 6 (.71, .72, .68, and .69 kg, respectively) compared with controls (.77). In summary, the multiple booster immunization treatment induced and maintained sufficient anti-GnRH titer to delay puberty for 175 d; a single immunization against GnRH with DEAE and NUFA increased antibody titers enough to delay puberty for 112 d. However, GnRH immunization treatments reduced ADG of heifers in Treatments 2, 3, 4, and

AB To investigate the effects because allowing Care Clay Cappy (MSA)

with different doses of a human serum albumin-Cys-Gly-GnRH (HSA-GnRH) conjugate on antibody titers, ovarian function, body growth, and carcass characteristics, 32 heifers (BW = 477 +/- 7.1 kg; mean +/- SE) were assigned to one of four immunization treatments: .1 mg of HSA or .01, .1, or 1.0 mg of HSA-GnRH, respectively. All heifers

received a primary (d 0) and booster (d 28) immunization using DEAE-dextran as adjuvant. The duration of the experiment was 158 d. Overall antibody titers against GnRH were greater (P < .05) for heifers immunized against GnRH (13  $\pm$  -3.3, 22  $\pm$  -3.8, and 19  $\pm$  -2.8% binding at a plasma dilution of 1: 640 for Treatments 2 to 4, respectively) than for controls (1  $\pm$ /- .1%). The numbers of heifers that became anestrous (plasma progesterone < .5 ng/mL for > 21 d) were 1/8, 8/8, 7/8, and 8/8, respectively. The interval from primary immunization to anestrus (40.7 +/-6 d) and the duration of anestrus (78  $\pm$ 7 d) were not affected by dose of HSA-GnRH conjugate. The number of ovulations detected was reduced (P < .05) in GnRH-immunized (4.6 +/- .64, 4.0 +/-.70, and 3.6  $\pm$ /- .60 for Treatments 2 to 4, respectively) compared with control heifers (9.4 +/- .20). During induced anestrus, follicular growth was generally arrested (< 5 mm in diameter) and plasma estradiol decreased. (ABSTRACT TRUNCATED AT 250 WORDS)

ANSWER 16 OF 20 MEDLINE 95080156 Document Number: 95080156. PubMed ID: 7988473. C-type natriuretic peptide (CNP) in the pituitary: is CNP an autocrine regulator of gonadotropes?. McArdle C A; Olcese J; Schmidt C; Poch A; Kratzmeier M; Middendorff R. (Department of Medicine, University of Bristol, United Kingdom. ) ENDOCRINOLOGY, (1994 Dec) 135 (6) 2794-801. Journal code: EGZ; 0375040. ISSN: 0013-7227. Pub. country: United States. Language: English. Natriuretic peptides act via receptors with intrinsic guanylate cyclase activity to stimulate cGMP production and are thought to be important regulators of neuroendocrine systems. C-Type natriuretic peptide (CNP) is of particular interest in this regard because the highest tissue concentrations of CNP occur in the anterior pituitary, where it is a highly potent stimulator of cGMP production. Here we show that pituitaries of rats and mice contain abundant CNP prohormone messenger RNA (mRNA), but no atrial natriuretic peptide or B-type natriuretic peptide prohormone mRNAs. Using reverse transcriptase-polymerase chain reaction, both A- and B-type natriuretic peptide receptor (GC-A and GC-B, respectively) transcripts were detected in rat and mouse pituitaries, although only the GC-B mRNA was measurable by Northern blotting. Immunohistochemistry revealed CNP-positive cells in the anterior, but not posterior, pituitaries of rats, and the vast majority of these cells were identified as gonadotropes by colocalization of CNP and LH immunoreactivities. Targeted toxicity using GnRH conjugated to the ricin-A chain was used to test whether gonadotropes are also direct targets for GnRH action. The conjugate dose dependently inhibited the proliferation of alpha T3-1 cells (gonadotrope-derived cells with GnRH receptors), but had no such effect on GH3 cells (which do not have GnRH receptors). Culture of rat pituitary cells with the conjugate caused comparable reductions in CNP-stimulated cGMP production, GnRH-stimulated LH release, and CA2+ ionophore (A23187) -stimulated LH release, but did not measurably alter cAMP production in response to pituitary adenylate cyclase-activating polypeptide. We conclude that CNP is synthesized in the pituitary, where it is located predominantly in gonadotropes, and GC-B receptors expressed in the pituitary mediate the direct effects of CNP in gonadotropes. Together with the recent demonstration of CNP synthesis and action in alpha T3-1 cells, the data suggest CNP to be a novel autocrine regulator of gonadotropes.

**DUPLICATE 8** ANSWER 17 OF 20 MEDLINE L3 95017847 Document Number: 95017847. PubMed ID: 7932367. Immunization of bull calves with a GnRH analogue-human serum albumin conjugate: effect of conjugate dose, type of adjuvant and booster interval on immune, endocrine, testicular and growth responses. Finnerty M; Enright W J; Morrison C A; Roche J F. (Teagasc, Grange Research Centre, Dunsany, Co Meath, Ireland. ) JOURNAL OF REPRODUCTION AND FERTILITY, (1994 Jul) 101 (2) 333-43. Journal code: JWN; 0376367. ISSN: 0022-4251. Pub. country: ENGLAND: United Kingdom. Language: English. AB

Bull calves were immunized with GnRH analogue-human serum albumin

(HSA-Cys-Gly-GnRH) conjugate to determine the effects of dose, adjuvant type and interval between primary and booster injections on plasma testosterone and LH concentrations, and testes and body growth. Friesian bull calves aged between 8 and 10 weeks (n = 72) were blocked according to age and weight and, within block, randomly assigned to 12 treatment combinations (n = 6 per treatment combination) in a 3  $\times$  2  $\times$  2 factorial plan. Main effects were (i) conjugate dose (0.0, 0.1 or 1.0 mg HSA-Cys-Gly-GnRH), (ii) adjuvant (diethylaminoethyl-dextran or non-ulcerative Freund's adjuvant), and (iii) interval between primary (day 0) injection and booster injection (day 28 or 56). Plasma testosterone and LH concentrations and antibody titres were determined in blood samples collected at 14 day intervals during the experiment (140 days). Testicular measurements were taken in situ every 28 days. Antibody titres (% binding at 1:160 dilution) were > or = 10% 28 days after booster injection and remained high for 140 days in 47 of 48 GnRH-immunized bulls. The mean titre was higher (P < 0.05) in response to the 1.0 mg dose compared with the 0.1 mg dose (37.7% versus 29.6% binding, respectively; pooled SED 2.55%). Mean LH and testosterone concentrations were reduced (P < 0.05) in immunized animals compared with controls. However, the 1.0 mg dose decreased mean testosterone concentrations by a greater extent (P < 0.001) than either the 0.1 mg or 0.0 mg doses. Testes length and depth, and scrotal circumference were decreased (P < 0.001) in immunized animals compared with controls; however, the 1.0 mg dose decreased (P < 0.001) testes parameters to the greatest extent. There was no effect of conjugate dose on average daily gain in body mass. It is concluded that (i) dose of conjugate, type of adjuvant and interval between primary and booster injections affected antibody titres, (ii) the use of 0.1 or 1.0 mg of HSA-Cys-Gly-GnRH decreased LH and testosterone concentrations, and testicular development throughout the experiment, without adversely affecting body growth, and (iii) an effective protocol is 1.0 mg GnRH-HSA conjugate, given in the adjuvant diethylaminoethyl dextran, with a primary-booster interval of 56 days.

- AB A vaccine against the gonadotrophin-releasing hormone (GnRH) is being developed as an immunol. method for treatment of prostatic hypertrophy, based on the observation that active immunization against GnRH leads to the prodn. of anti-GnRH antibodies which results in the shrinkage of the prostate gland. The authors have been investigating the regulation of anti-GnRH antibody responses by carrier mols. In previous studies the authors showed that the use of large protein mols. as carriers limits the use of such a vaccine owing to potential problems of carrier-induced anti-haptenic suppression. In this report the authors show that synthetic T-helper epitopes can be used as carriers for the generation of anti-GnRH antibody responses.

- AB Forty-six Simmental times British Friesian bull calves were allocated to six treatment groups. In four groups (each of eight animals) half the animals were given a prime injection of gonadotropin-hormone-releasing-hormone (GnRH) either as the decapeptide or as an octapeptide (residues 3)

to 10) conjugated to egg albumen. Prime injection times were at 3, 4, 5 or 6 months of age. All animals were boosted with a GnRH conjugate, similar to that used for the prime injection, at 8 months, six other animals were surgically castrated while the remaining eight were left as untreated bull controls. Weight gain and consumption of a barley-based diet offered ad libitum were recorded for individual animals. Blood samples were taken at a minimum of fortnightly intervals and the serum analysed for antibody titre against GnRH, testosterone and insulin-like growth factor 1 (IGF-1). Animals were slaughtered at 12 months and chemical analyses performed on the disectible material of the 10th rib for protein, lipid, ash and water conent. Greater antibody titres and a longer period of low serum testosterone were achieved with the octapeptide conjugate compared with the decapetide. Serum IGF-1 slowly decreased following both surgical- and effective immuno-castration. There were no significant differences in food intake between the groups. Both steers and the more responsive immunocastrates had higher fat (P lt 0.01), lower protein (P lt 0.05) and water concentrations (P lt 0.01) in tissues from a rib sample joint compared with untreated bulls. As immunoresponsiveness decreased there were indications of compensatory changes in body compsition. The technique may be applicable during periods of, for example, mixed grazing for bulls.
